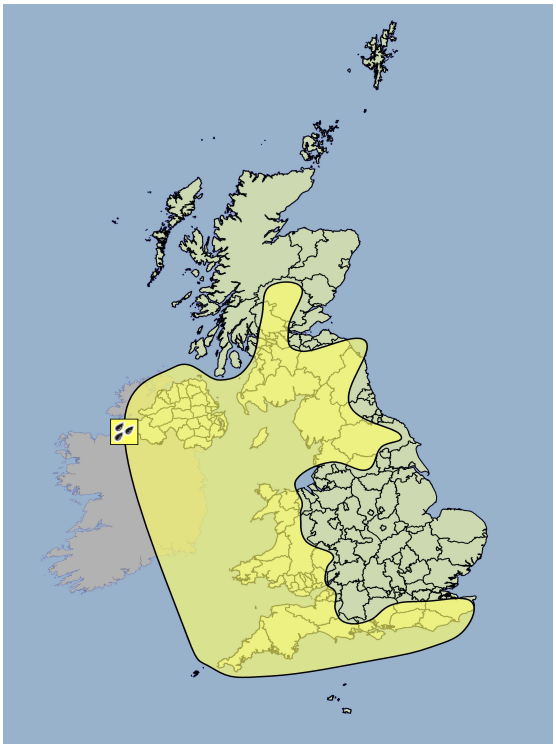
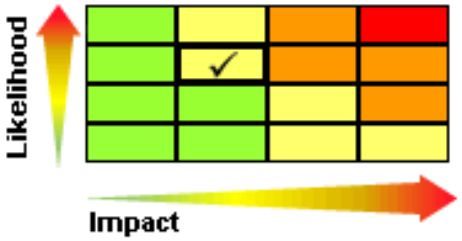
National Severe Weather Warning Service





Chief Forecasters Assessment
Another deep area of low pressure is expected to develop over the Atlantic Ocean mid-week, bringing another spell of wet and windy weather across the UK as it tracks northeastwards past northwestern Britain later on Thursday and during Friday. Snowmelt over higher ground in Scotland will increase the contribution to river catchments here.

Relative to recent storms that have affected the UK, Friday's depression is looking less intense and the extent of associated impacts are currently thought to be less widespread and less severe. However, at this stage there remain some uncertainties concerning the track and depth of this storm and this warning will be re-assessed and updated over the coming days.

The Met Office have issued a **Yellow Alert** of **Rain**

Valid from **00:05 on Fri, 27th Dec 2013** until **18:00 on Fri, 27th Dec 2013**

Spells of rain affecting the UK late Thursday and Friday are expected to be heavy at times with 10 to 20 mm expected to fall quite widely. Locally in excess of 30 mm is likely over parts of Wales, Northern Ireland and southern England whilst more than 40 mm are expected locally over Scotland and northern England.

The public should be aware of the potential for disruption, especially where ground is already saturated and where high winds are combined with heavy rainfall. Please watch for updates to this warning over the coming days, especially those who have travel plans.
